Patent No. 6204013
GENERAL INFORMATION:
APPLICANT: Khodadoust, Mehran
TITLE OF INVENTION: NOVEL MSP-5 PROTEIN AND NUCLEIC ACID MOLECULES
TITLE OF INVENTION: AND USES THEREOF
COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                        NUMBER OF SEQUENCES: 4

```

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
```

The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SAGA )

This cDNA clone encodes human secretory peptide-9, or Zsig9, variant (see AAW88474). Zsig9 (see also AAW88469) is overexpressed human brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid and lymphoma tumors. Thus, Zsig can be used as an indicator for cancer. Zsig9 cDNA was discovered in a placenta clone from a full-term pregnancy cDNA library which contained an expressed sequence tag (see AAX06971). The invention provides polynucleotides (see AAX06968-70) encoding Zsig9 polypeptides (see AAX06977) including manture polypeptides, other processed forms, variants and mouse orthologues. The Zsig9 gene, or probes derived from it, can be used to determine if Zsig9 is present on chromosome

Antibodies raised against 2sig9 can be used as diagnostic agents to determine the presence of 2sig9, and thus the presence of cancer. They can also be labelled with radioisotopes or fused with toxins and used to treat tumours which overexpress Zsig9. Antisense nucleotides derived from Zsig9 cDNA can also be used to inhibit the growth of tumour cells. Zsig9 proteins can be used to enhance the growth or development of the placenta, heart or liver.

                                                                                                                        The present DNA sequence is a gene encoding the variant of the secretory protein-9, Zsig9 that arises due to alternative splicing, allelic variation or silent mutations that result in amino acid changes. This sequence is mapped to the human chromosome 12q15 region. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to Zsig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to Zsig9 and it may be radiolabelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of Zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding Zsig9. The Zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
This sequence represents the human cDNA clone HP10390 which encodes a 20 kD protein with one putative transmembrane domain in the N-terminus. The CDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, assay reagents, as diagnostic tissue markers, for the isolation of
                                                                                                                                                                                                                             Human proteins with transmembrane domains, proliferation and differentiation, useful finflammation -

Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.

                                                                                                                                                                                                                                                                                                             US-10-082-502-20 (1-162) x ABK52765
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to modulators of a cancer-related genes. Also CC described are: (1) processes for identifying an anti-neoplastic agents CC comprising contacting a cell exhibiting neoplastic activity with a CC compound first identified as a cancer related gene modulator, and CC compound first identified as a cancer related gene modulator, and CC detecting a decrease in the neoplastic activity. (2) a process for CC determining the cancerous state of a cell by determining an increase in CC the level of expression of at least one gene, where an elevated CC expression relative to a known non-cancerous cell indicates a cancerous CC state or potentially cancerous state. The anti-neoplastic agent is CC useful for treating cancer or for protecting an animal against cancer. CC The immunogenic composition is also useful for treating cancer in an CC animal, where the composition elicits the production of cytotoxic TC complosition should be a human. The cancer-linked genes and polypeptides are also CC useful as targets for cancer therapy or chemotherapy. The present CC sequence represents a cancer-linked genes and polypeptides are also cancer transmembrane acceptance in a cancer of the context 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              12-OCT-2000;

```

The specification describes a method of antibody preparation. The method comprises inoculating an animal with a vector expressing a fusion protein having an antigen protein fused to the C-terminal side (extracellular) of a transmembrane domain protein (the

intracellular),

The antibodies can be used
as drugs, vaccines, diagnostic reagents and laboratory reagents. The
present sequence encodes a polypeptide, designated HP10390, which was
used in the course of the invention.

The CC polypeptide comprising a portion of an ovarian tumour protein. The CC sequences of the invention are useful for stimulating an immune response and for treating ovarian cancer in a patient. An antigen presenting cell that expresses the sequences is useful for treating ovarian cancer by CC incubating CD4+ and/or CD8+ T cells isolated from a patient. The T cells CC can then be proliferated and administered to the patient to inhibit the CC development of cancer. The DNA sequences are useful as probes or primers CC for nucleic acid hybridisation, to direct expression of a polypeptide in appropriate host cells. Detecting the presence of a cancer in a patient in a patient converse obtaining a biological sample from the patient, contacting the amount of protein that binds to the agent, comparing the amount of concer. Sequences ABK09464-ABK09802 represent PCR primers and cDNA concerning ovarian tumour proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
The invention relates to nucleic acid sequences (AAX22111 to AAX22134) CC encoding human secreted proteins (AAV01135 to AAX01135). The secreted protein gene sequences are deposited with the ATCC under deposit number ATCC 209118. Host cells comprising recombinant vectors containing the cc nucleic acid sequences are used for the recombinant production of the secreted proteins. The polynucleotide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a cc sample or by determining the amount of the new polypeptides in a cc polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developmental abnormalities and foetal deficiencies, autoimmune diseases, lymphomas, Alzheimer's and cognitive disorders, autoimmune diseases, immune deficiency diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-SEP-1997;

CC AAS21244-AAS21518 encode for novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CPRO polypeptides, to link bloactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, recttal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the CC tumour necrosis factor-alpha (TNF-alpha) from human blood, the cartilage, the proliferation of chondrocytes, the proliferation or coartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide complexities can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, can be completed in an analysis of the properties can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-DEC-1999

The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures.

This cDNA clone encodes novel mouse secretory peptide-9, or 2sig9 (see AAW88476), an orthologue of novel human Zsig9 (see AAW88469). Chuman Zsig9 is overexpressed in a number of tumours including brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid and lymphoma tumors, and thus can be used as an indicator for cancer. The invention provides polynucleotides (see AAW86469-70) encoding Zsig9 polypeptides (see AAW86469-77) including mature polypeptides, other processed forms, variants and the mouse orthologues. The Zsig9 gene, or probes derived from it, can be contained and colored as diagnostic agents to determine the presence of zsig9 and thus the presence of cancer. They can also be labelled with tradicisotopes or fused with toxins and used to treat tumours which overexpress Zsig9. Antisense nucleotides derived from Zsig9 colored colored can be used to inhibit the growth of tumour cells. Zsig9 colored can be used to enhance the growth or development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         03-JUL-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present DNA sequence is an ortholog encoding the secretory protein-9, zsig9 derived from mouse. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to Zsig9 are unseful for detecting and treating tumours. The antagonist may be an antibody or receptor to zsig9 and it may be radio-labelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of Zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding Zsig9. The Zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma etc., at an early stage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure;

                                                                                                                                                                                                                            The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders ce.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis), infectious disorders (e.g. hepatitis), allergic conditions (e.g. asthma), neurodegenerative disorders (e.g. allergic conditions (e.g. neurodegenerative disorders (e.g. hamemophilia), and tumours. The polynucleotide sequences of the invention are also useful in gene therapy. ABK35610-ABK36232 represent the cDNA sequences of the invention that encode for novel human

The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.

Cc chemokinetic; proliferative; immunomodulatory; haematopoletic; cc chemokinetic; antilestic; immunomodulatory; haematopoletic; antilasthmatic; antilasterial; antilucer; osteopathic; antilabetic; cc cytostatic; antilacer; antilucer; osteopathic; antilabetic; cc antiasthmatic; vulnerary; antilucer; osteopathic; neuroprotective; cc anticonvulsant; and antidepressant. The SESTs can be used for gene therapy and in vaccines. The SESTs are useful as probes for the cc identification and isolation of full-length cDNAs and genomic DNA cc molecules which correspond to the SESTs. Proteins encoded by the SESTs care useful in assays for determining biological activity and raising cc antibodies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions cc (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, cc osteoporosis, osteoarthritis, central nervous system disorders (CC Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation cc disorders (haemophilia, thrombosis), inflammatory disorders (Crohn's cc disease), tumours, bacterial, fungal or viral infections, depression and psoriasis. AAA45926 to AAA45931 represent linker variants which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                   AAA43426 to AAA45925 represent specifically claimed secreted expressed sequence tags (SESTs), isolated from human, mouse, chicken and rat tissue sources. The SESTs can have a range of activities depending on the tissues they were isolated from. The activities include:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (sESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vaccine; autoimmune disorder; multiple sclerosis; allergic conditional. dependent diabetes; asthma; myeloid cell deficiency; ulc lymphoid cell deficiency; burn; osteoporosis; osteoarthritis; central nervous system disorder; Alzheimer's disease; stroke; Parkinson's disease; Huntington's disease; coagulation disorder; haemophilia; thrombosis; inflammatory disorder; Crohn's disease;

Submitted (26-JAN-2002) Lita Annenberg Hazen Genome Sequencing Center, Cold Spring Harbor Laboratory, 1 Bungtown Road, Cold Spring Harbor, NY 11724, USA
On Jan 26, 2002 this sequence version replaced gi:18201765.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >-
30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mus musculus Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; E Mammaila; Eutheria; Rodentia; Sciurognathi; Muridae; 1 (bases 1 to 207424) Spiegel, L., Preston
